

# 20245 Equitably Applying Artificial Intelligence in the United States Workforce Using Training and Collaboration

## 1 **Equitably Applying Artificial Intelligence in the United States Workforce Using Training and** 2 **Collaboration**

3 **Policy Date:** October 29, 2024

4 **Policy Number:** 20245

5 Abstract

6 Advances in artificial intelligence (AI) have raised ethical concerns related to fairness, privacy, and trust.  
7 While AI may improve elements of the economy, its benefits will be unevenly experienced, with more  
8 than half of the jobs in the United States expected to become partially automated in the next 15 years.  
9 Workers at all levels could face disruptive changes and financial hardship as AI transforms work tasks. AI  
10 can bring about positive change, but systems must be built to use this technology responsibly and share  
11 the benefits equitably. Workers, their advocates and representatives, and members of the community  
12 should be included in the development and implementation of AI in the workplace. Guidance that  
13 considers equity, protection of vulnerable populations, and just outcomes is needed. Organizations may  
14 welcome these recommendations because of the challenges of using AI. This policy statement  
15 recommends four key approaches for implementing AI that focus on the workplace. First, more research  
16 is needed to determine and monitor the impact of AI. Second, training programs should be created to help  
17 those losing jobs to augmentation, support diverse leaders for the future of AI, and help people adapt to  
18 AI. Third, academic, labor, and community organizations with expertise in technology equity should  
19 engage with AI developers to offer practical tools, understand implications, and create equitable  
20 outcomes. Finally, programs that promote accessibility and inclusivity in AI should be developed, and  
21 there should be ongoing monitoring of AI applications for workers.

22

23 Key words: Artificial intelligence (AI), workers, technology, equity, computers

24

Problem Statement

The use of artificial intelligence (AI) and computer learning is expected to substantially change the outlook, design, and availability of jobs.[1] Research exploring the ethical considerations of AI is still in its infancy. [2] While this technology is actively evolving, there is a time-sensitive opportunity to intervene with ethical guidelines to inform practical applications. More than half of total U.S. employment is at risk for greater automation or computer augmentation in the next 15 years, notably in transportation, administrative support, production, and service occupations.[3,4] Real-world examples include technological advances in computerized cars, algorithms for storing and retrieving data, environmental and biosensor monitoring for safety or health, video facial recognition, industrialized robots, and many others.[3,5]

While AI may improve the overall economy, the efficiencies it is capable of bringing will also likely lead to job losses in certain sectors. Labor analysts predict that AI will impact knowledge workers, including those involved in jobs in higher education.[6] It could also exacerbate inequities between workers with jobs that require training or specialization who may benefit from increased efficiency using AI and unspecialized workers who risk being replaced by AI.[7,8] Although tasks done by essential workers such as drivers, firefighters, child-care workers, and nursing assistants cannot be easily replaced by AI, some jobs currently filled by vulnerable workers could be affected by the growth of the technology. AI augmentation is expected to influence female workers twice as much as male workers because of the high impact on those in job roles such as secretaries and clerical staff, which may be more commonly filled by women, especially in high-income countries where more technology is used.[9] An American Psychological Association survey revealed that 38% of workers were worried that some or all of their duties would be replaced by AI in the future, and more than half of these people were already under current mental strain because of their job stress. Moreover, young workers, workers of color, and workers with a high school education were more likely to express worry about AI making their job obsolete.[10] However, among people who interact with AI regularly, more are hopeful that it will make their job easier (32%) than worried that it will hurt more than help (11%) according to a Pew Research Center survey.[11] Building systems without the input of workers may result in unintended consequences such as job loss or unanticipated impacts, particularly loss of worker autonomy or job control, which is linked to loss of income, job insecurity, and poorer overall worker well-being.[12]

## 20245 Equitably Applying Artificial Intelligence in the United States Workforce Using Training and Collaboration

66 Public health principles can help ethically guide the growth of AI, including the monitoring of social and  
67 community impact, based on historical context. There have been multiple industrial revolutions with the  
68 adage of machines to manufacture products, leading to production and efficiency increases, decreased  
69 prices for goods, and migration of workers to seek employment. However, these changes resulted in  
70 unique exposures to occupational injuries and illnesses among vulnerable populations, often marginalized  
71 individuals. The first industrial revolution (steam), the second industrial revolution (electricity), and the  
72 third industrial revolution (dissemination of information via computers) led to shifts in labor markets and  
73 manpower.[13] The current and developing state of AI is considered part of the fourth industrial  
74 revolution.[14] It will be important to delineate what humans continue to do better than AI—where  
75 optimization and efficiency are not the primary drivers, such as in the case of service and health care  
76 occupations. Yet, we should remain mindful that similar challenges related to labor shifts occurred in  
77 prior technological advancements and may provide insight that the most vulnerable populations are at risk  
78 of unethical practices.

79

80 Current innovations in AI are providing dramatically new possibilities. [15] AI encompasses many forms  
81 of machine-based, cognitive problem-solving capabilities such as machine learning, natural language  
82 processing, and robotics. This powerful tool can be used to recognize patterns in large data sets to mimic  
83 human decision making. [16] AI is being used or considered for adoption by a variety of industries to  
84 support data-driven, efficient solutions with both internal and external data sources. Examples include  
85 monitoring workplace hazards with wearable technology, assessing the risk of arrestees offending in the  
86 future, and providing super-human abilities such as those in exoskeletons.[17–19] Early reports of AI in  
87 the workplace have shown increased productivity, better dissemination of best practices, increased  
88 accuracy, and improved safety.[20,21] Research suggests that AI should be used as an employee  
89 assistance tool and not improperly applied to cause decreased job control.[12]

90

91 While there is a great deal of anticipation surrounding the possibilities of AI, as with any fast-paced  
92 technological advancement, there are ethical concerns including a lack of fairness, autonomy, privacy,  
93 transparency, security, and trust.[22] Regarding cultural responsiveness to underrepresented and  
94 underserved populations, plans are needed that address specific cultural and contextual gaps in areas such  
95 as cultural competence, transparency in legislation, and fostering of international cooperation to recognize  
96 long-term economic shifts, effects on small businesses, and disability access.[23] These principles overlap  
97 with public health core values, suggesting that public health is in a unique position to offer guidance that  
98 considers equity, protection of vulnerable populations, and just job outcomes when applying AI.[24]

## 20245 Equitably Applying Artificial Intelligence in the United States Workforce Using Training and Collaboration

99 Public health has played an important role in protecting vulnerable populations and supporting human  
100 health and dignity.[25] Ethical oversight in this capacity has precedent from the federal policy for the  
101 protection of human participants and the application of institutional review boards (IRBs) in human  
102 participant research.[26] There is a need for ethical design principles that support health and protect  
103 privacy from the onset of AI development rather than only oversight after deployment.[27] Companies  
104 may welcome these recommendations because there are many challenges in using AI effectively to realize  
105 performance gains, ensure high-quality outputs, and preserve a company's reputation.[28]

106  
107 As is the case in other areas, occupational health and safety is a rapidly evolving field, and there are  
108 limitations on data and guidance available related to AI. However, it is important to prevent harm caused  
109 by unethical practices that may result from delaying policy and action.[29] Doing so may prevent  
110 exacerbation of occupational health disparities that are already well defined and recognized as barriers to  
111 and facilitators of occupational health and safety equity, for example disparities related to race, sex,  
112 gender, ability, age, rurality, and geographic location.[5] Beyond the need to focus on occupational  
113 health, public health must also address the critical need for developing and supporting ethical frameworks  
114 for implementing AI across the broader public health workforce. Public health is at a pivotal point, with  
115 opportunities for transformation and data modernization, while also facing challenges such as workforce  
116 shortages. Chronic capacity challenges combined with widespread hostility toward public health  
117 professionals have led to high levels of burnout and turnover, with nearly 50% of the members of the  
118 government public health workforce estimated to leave their jobs by 2025.[30] Using AI tools  
119 deliberately and strategically could augment capacity and ease staffing shortages. Seeing AI as an  
120 opportunity requires a commitment to workforce education and skill training to ensure that workers are  
121 not left behind and feel valued amid technology changes. To better assess training needs and develop  
122 guidelines for AI use, public health organizations should lean into their strength in data gathering,  
123 embracing testing and evaluation of various AI capabilities on the job and fostering collaborations with  
124 the technology sector to ensure ethical implementation. Organizations should prioritize learning and  
125 adaptability within their workforce as well as engage with diverse communities to understand broader AI  
126 implications. Decisions about how AI can most effectively increase capacity and how to best integrate it  
127 into workflows should be based on data that can also make clear where and how humans offer  
128 irreplaceable oversight and value.

129  
130 AI relies on building information models based on data. However, data can be flawed, biased, and even  
131 discriminatory as a result of real-world collection limitations, a concern raised by the American Civil

## 20245 Equitably Applying Artificial Intelligence in the United States Workforce Using Training and Collaboration

132 Liberties Union. [31] While AI shows promise, establishing representative data for algorithm building  
133 and ongoing ethical audits will require significant commitment to ethical standards. For example, if AI is  
134 used in recruitment and hiring practices, policies and procedures will be needed to ensure that the  
135 algorithms do not lead to bias and discrimination and to address the mental health effects of AI  
136 monitoring on employees.[5,10] Certain populations, such as the LGBTQI+ (lesbian, gay, bisexual,  
137 transgender, queer, and intersex) community, may be at higher risk of being vulnerable to language bias  
138 in AI that can perpetuate harmful stereotypes and reinforce discriminatory practices, emphasizing the  
139 need for privacy-preserving techniques.[32] Key strategies for protecting privacy include developing  
140 adversarial filters to obscure identifying information and involving diverse voices in AI design.  
141 According to the World Health Organization, regulation is a desirable way to manage the risks of AI  
142 amplifying biases related to human data.[33] Comprehensive frameworks that safeguard AI data, address  
143 system vulnerabilities, and ensure ethical and regulatory compliance are necessary to protect sensitive  
144 information.[34] Public health organizations should not wait for AI developers to address issues of bias  
145 and equity; it is critical to identify implicit and explicit bias in data sources and eliminate it using AI  
146 rather than perpetuating it.  
147

148 U.S. state legislators have passed or proposed bills related to reasonable care of AI development to  
149 prevent discrimination and provide disclosures to consumers in Colorado, California, and Florida.[35–37]  
150 The White House published an executive order, the AI Bill of Rights, in October 2023 that highlighted  
151 the need for safe AI systems that protect against discrimination, provide privacy, and give appropriate  
152 notice where and when it is used.[38] Many leading AI companies, including Google, Microsoft, Meta,  
153 and Amazon, have signed voluntary commitments to this executive order.[39] There are also federal bills  
154 regarding AI transparency including disclosures and establishment of standards for AI use in federal  
155 agencies with sensitive data.[40,41] Other countries and entities such as Australia and the European  
156 Union have developed voluntary ethical standards related to trustworthy and responsible AI  
157 development.[42,43] However, more is needed to guide what is defined as ethical, which populations are  
158 vulnerable to negative outcomes of AI, and best practices for ethical AI development.  
159

160 Beyond various occupational applications, AI will also impact related industries, such as insurance and  
161 health care, that affect working-age people.[44] The U.S. Department of Health and Human Services, an  
162 overseer of health care delivery and public health practice, has proposed an AI rule about transparency  
163 when dealing with health data.[45] Public opinion is already forming, with one survey revealing that 86%  
164 of participants are worried about where generative AI in health care obtains information and the validity

165 of that information.[46] There are still many unknown aspects of AI, including those associated with  
166 clinical applications and how to overcome underrepresentation in medical care among certain  
167 populations.[32,47]

168

#### 169 Evidence-Based Strategies to Address the Problem

170 AI is an emerging field with the potential to significantly enhance public health functions such as targeted  
171 interventions, real-time surveillance, and resource allocation. For instance, during the COVID-19  
172 pandemic machine and deep learning enabled rapid diagnosis, real-time data analysis, and improved  
173 emergency preparedness.[48] In health promotion, AI has been used for sentiment analyses of social  
174 media data to better target public health campaigns and employed to predict lead poisoning risks among  
175 children, allowing for more targeted interventions.[49] AI's integration into health care requires careful  
176 consideration of ethical frameworks, regulatory standards, and social acceptance.[50] Despite the  
177 potential of AI, widespread use of the technology faces challenges including suboptimal data quality,  
178 representation bias, and privacy concerns, highlighting the need for ongoing improvements and  
179 international coordination to effectively manage future public health crises.[51] The strategies described  
180 subsequently align with principles recommended for developers and employers by the U.S. Department of  
181 Labor and bridge additional stakeholders relevant to public health.[52]

182

183 More data and research are needed to understand the impact of AI and can be used to inform future  
184 policies. Comprehensive socioeconomic impact studies, especially those focusing on vulnerable  
185 populations, are needed. These studies could help forecast the long-term effects of AI on employment, the  
186 economy, intellectual property, and societal structures, providing a basis for more informed  
187 policymaking. A multidisciplinary collaboration involving experts in ethics, law, psychology, and  
188 sociology alongside AI developers and data scientists can provide a holistic approach to AI solutions. AI  
189 systems should be designed via a context-sensitive approach, taking into account cultural nuances to  
190 avoid reinforcing harmful stereotypes, exacerbating existing disparities, or nonconsensually identifying  
191 certain populations such as those in the LGBTQI+ community or individuals with disabilities.[32,53]  
192 Culturally diverse and representative data sets are needed to avoid biases in AI algorithms, including  
193 ongoing community engagement, feedback, and adaptation to ensure that AI-driven solutions remain  
194 effective and equitable in communities such as those of indigenous people or those in multilingual health  
195 systems.[54]

196

## 20245 Equitably Applying Artificial Intelligence in the United States Workforce Using Training and Collaboration

197 Applying research findings to educate and engage the public about AI will be vital to manage public  
198 expectations and prepare society for the changes AI is bringing. Partnering public health with commercial  
199 entities could increase positive population-level impacts by supporting research to practice.[55] Research  
200 could also be used to monitor, evaluate, and adapt AI systems on an ongoing basis to ensure that  
201 strategies and policies governing the technology remain relevant and effective. This can include  
202 implementation of policies and practices for managing processes, creating audit trails, encrypting  
203 sensitive data, and adopting data minimization principles. [27,34,56] A website to share experiences and  
204 foster best practices would allow more people to benefit from ongoing development of ethical AI. [57,58]  
205

206 With near-human intelligence, AI can bring about positive change, but AI systems must be built  
207 responsibly to share in the prosperity rather than benefiting a small number of individuals and  
208 concentrating existing wealth.[59] Using AI in partnership with the environment in which it is being used  
209 can lead to better, more equitable outcomes.[60] Examination of AI output may indeed help inform where  
210 discriminatory practices exist so that actions can be taken to remedy inequities.[61] Guidance for ethical  
211 AI should use public law and human rights principles to offer practical advice that can be implemented in  
212 any sector.[18] This includes providing transparent and reliable results that can be duplicated.[62] In the  
213 workplace, evidence-based, scientific principles should be used that anticipate challenges, such as using  
214 an AI workplace health and safety scorecard with identified workplace hazards. This will help create AI  
215 implementation plans that are feasible, affordable, and ethical while also being cognizant of adopters'  
216 likely varying capabilities of application.[63] Equity impact analyses can be used to better understand the  
217 tradeoffs between cost effectiveness and equitable outcomes.[64]  
218

219 As AI becomes more acceptable in the workplace, occupational health and safety practitioners are in a  
220 beneficial position to advocate for worker-focused decisions and to educate organizations about the  
221 physical and psychosocial conditions affecting workers if there are AI system failures or dysfunction.[63]  
222 Investment in training workers at risk of losing their jobs to computerization would help people transition  
223 into jobs with ongoing demand.[9] Targeted investment in digital infrastructure, particularly in rural and  
224 underserved urban areas, can help communities that currently lack access to digital solutions.[65]  
225 Involving people with disabilities in the development of AI solutions and integrating accessibility training  
226 into computer science curricula can ensure that AI technologies are inclusive.[66] Furthermore, creating a  
227 pipeline of diverse leaders for the future of AI, as being implemented by Lakota tribes, can help combat  
228 blind spots in AI systems due to human discrimination impacting data.[67] AI standards are currently  
229 voluntary; however, especially in terms of monitoring employee output, implementing regulations that

## 20245 Equitably Applying Artificial Intelligence in the United States Workforce Using Training and Collaboration

230 allow workers to know what, when, and why processes are monitored or placing limits on employers' use  
231 of algorithmic management is needed to protect employee mental and physical health.[9] This should  
232 include disclosure of when, where, and how AI is being used in the workplace.

233  
234 There are potential vulnerabilities surrounding the proposed strategies, for example training staff with AI.  
235 The use of AI in training should be monitored by a trained instructor to assess validity of content,  
236 appropriate delivery to the trainees, and whether the intended outcomes are accurate. For those without  
237 technological fluency, comfort, and accessibility, employers will need to consider the quality and depth of  
238 training programs by ensuring that training includes understanding of technical components and language  
239 used as well as raising the comfort of workers using such programs.[68]

240  
241 Navigating the challenges of AI: Corporations are at the forefront of AI users, and many companies are  
242 developing policies to help navigate the challenges of AI usage. For example, Amazon Web Services  
243 offers AI services and touts responsibly built AI, including fairness, security, and transparency, as part of  
244 its business offerings. [69] At present, however, the action steps behind the company's guiding principles  
245 are not required to be published or reported.

246  
247 Currently, lawsuits related to AI are making their way through the court system, likely outlining the future  
248 of AI practice. One class-action lawsuit against an insurance company claims that inaccurate AI was used  
249 to deny health care to elderly patients.[70] Other lawsuits claim copyright infringement by authors and  
250 artists whose writing and images were used to train AI models.[71] The decisions in these court cases will  
251 be decided not by technical experts but by judges using existing laws and subject-matter-expert  
252 recommendations applied to the new technology usage of AI. This liability precedent likely will have  
253 long-term impacts on how responsible use of AI is defined. For the reasons just described, more research  
254 outlining best practices for those using AI would help ensure safe and ethical application of the  
255 technology.

256  
257 Leveraging established systems: At the Massachusetts Institute of Technology, researchers developed AI  
258 that could be used to screen recordings of a human cough to diagnose COVID-19. [72] The research was  
259 housed in an academic setting, reviewed by an IRB, and overseen by a team trained to search for  
260 limitations. In this case, the development team suspected age and cultural differences in coughs that were  
261 outside of the training data and clearly outlined the risks to public health if COVID-19 is overdiagnosed  
262 or underdiagnosed. The authors concluded that clinical trials with more samples will be needed to perfect

## 20245 Equitably Applying Artificial Intelligence in the United States Workforce Using Training and Collaboration

263 the technology. While some medical applications of AI do have oversight such as requiring clinical trials,  
264 this is not the case for all AI. Use of already-established IRBs, for example those at universities, health  
265 institutions, or corporate companies, could prove to be a quick, practical, and ethically sound way to  
266 provide external, community-based feedback to companies developing AI. This could include university  
267 IRBs, professional societies such as Public Responsibility in Medicine and Research, or companies that  
268 sell IRB reviews.

269  
270 There is a need to address the education of workers and inclusion in the development and implementation  
271 of AI in the workplace. The AFL-CIO (American Federation of Labor and Congress of Industrial  
272 Organizations) and Microsoft, a major labor union and technology company, respectively, partnered to  
273 encourage such open discussion.[73] The goals of the partnership are to share knowledge between labor  
274 leaders and workers on AI, include workers' expertise in AI development, and shape policy that supports  
275 technology skills and the needs of workers. The partnership includes an agreement with Microsoft to  
276 respect workers' rights to form or join a union, build labor-management relations, and negotiate collective  
277 bargaining agreements when considering evolving technologies. The collaboration aims to deliver on key  
278 aspects toward achieving ethical and equitable AI use. First, Microsoft plans to provide formal education  
279 to labor leaders and workers on how AI works, opportunities, and possible challenges and to explore  
280 training students for potential careers in the field. Second, feedback from labor leaders and workers will  
281 proceed directly to the AI technology developers, focused on unions and workers from critical fields.  
282 Lastly, the partnership aims to support policies that prepare workers with the skills and knowledge needed  
283 to advance, including supporting the expansion of apprenticeships.

284

### 285 Action Steps to Implement Evidence-Based Strategies

286

	Evidence-Based Strategy		Action Steps
1	Gather more data and research to inform policy.	1a	Federal agencies and private organizations should increase funding for AI research to determine the impact on vulnerable populations, establish best-practice recommendations, and monitor changes to ethical considerations for AI and human interfaces within the workplace, which will help ensure an equitable reach to underserved and underrepresented workers.

20245 Equitably Applying Artificial Intelligence in the United States Workforce Using Training and Collaboration

2	Create educational pipelines and programs.	1b	A website to share best practices for AI projects should be established by industry leaders to encourage transparency, ethical practices, and collaboration between public and private entities applying AI to the workforce.
		2a	Union leadership should explicitly prepare trainees to transition from occupations at the highest risk of computerization to careers that are sustainable within the shift to use AI. Congress and funding initiatives should prioritize such investments.
		2b	Union leadership and technology leaders should encourage pathways to technical and career AI roles, including in leadership, and should incorporate diversity recruitment from underrepresented and historically excluded populations to create robust oversight of AI implementation and combat potential human bias in data and data collection.
		2c	Educational materials by scholars should be developed and targeted at different age groups, experience levels, and diverse communities to foster a broader understanding and use of AI. These materials could help both workers and the general public understand and adapt to AI technologies.
3	Build cross-cutting partnerships between stakeholders, including nonprofit organizations, industry, academia, advocacy groups, and	3a	Institutional review boards and ethical committees currently used in research, academic, and nonprofit settings that focus on technology ethics should offer assistance to organizations implementing voluntary AI standards by providing practical assessment tools and guidelines for research and evaluation. Channels for ongoing feedback from these stakeholders should be established to continuously improve AI practices.

20245 Equitably Applying Artificial Intelligence in the United States Workforce Using Training and Collaboration

	3b	<p>Unions and technology stakeholders should work collaboratively to emphasize the experiences and voices of workers in the assessment and evaluation of AI in the workplace and community. Such assessments should be robust and acceptable to workers and should not contribute to psychological or physiological stress. They should include a diverse range of worker experiences and voices, including those from a variety of roles, levels of expertise, and backgrounds, to ensure a comprehensive evaluation.</p>
<p>4 Increase technology accessibility and inclusivity.</p>	4a	<p>Federal or state agencies should fund the development and launch of AI pilot projects while concurrently establishing a community of practice. These pilot initiatives will be designed to assess AI applications across various sectors, offering invaluable insights. Simultaneously, communities of practice will foster knowledge exchange and collaboration among experts, aligning with the strategic vision to drive effective AI deployment and promote a culture of continuous learning and ethical practice in the field.</p>
	4b	<p>Workforce development associations and health-related professional associations should promote the development of AI technologies that are inclusive and cater to diverse needs, and these technologies should be offered or incentivized to explore AI applications that benefit areas that are not currently profitable.</p>
	4c	<p>Federal agencies and private organizations must develop strategies and detailed execution plans that explicitly and fully address the cultural and contextual needs of underrepresented and underserved populations. This can help ensure that communities and worker populations that are difficult to reach are included and provided accessibility.</p>

287

288 Opposing Arguments

289 There are arguments against creating AI oversight. Organizations face post pandemic challenges

290 including worker shortages, strain on supply chains, and rising medical costs that can be overcome, in

## 20245 Equitably Applying Artificial Intelligence in the United States Workforce Using Training and Collaboration

291 part, by using intelligent systems that require fast-paced innovation and adoption.[19] However, corporate  
292 profits should not be prioritized over building systems that equitably support business growth and a safe  
293 work environment. Implementing smart technologies can lead to improvements in worker health and  
294 safety in real time, and increased oversight may delay the application of these technologies. [17,74]  
295 Without a review of the impact of smart technologies, notably on mental health, these improvements may  
296 result in short-term gains but long-term challenges.

297  
298 Also, according to technology developers, there are more pressing concerns than ethical ones, such as AI  
299 being weaponized to execute cyberattacks. Ongoing resources will be needed to protect data and remain  
300 at the cutting edge of AI cybersecurity, particularly when personally identifiable information is at  
301 risk.[75] While national security and data privacy are important, most AI projects will not be at that level  
302 of security risk and should be subject to ethical considerations.

303  
304 Finally, companies that voluntarily comply with ethical standards may lose their competitive edge in the  
305 marketplace by having slower releases of AI.[63] However, companies that deploy AI efforts that risk  
306 their client data or workforce face economic fallout, specifically loss of customers, increased employee  
307 turnover, and lost confidence in branding as well as potential legal turmoil via lawsuits.
